WorkNest Introduction Script

Oct 13, 2026 · @Cobi

A 3-minute spoken opening for the WorkNest presentation, matched to slides 1 to 7 of the deck: what the project is, the problem it solves, and how we solved it.

The script

Seven slides, about 3 minutes. Each block names the slide on screen, then what to say. Speak it in your own words; don't read it out.

Slide 1: WorkNest (20 seconds)

Say: "Good morning everyone. We're [names], and this is **WorkNest**: a platform where job seekers find and apply for jobs, and where recruiters manage the whole hiring process in one place. Our tagline says it simply: *find work, hire faster.*"

Slide 2: Hiring is scattered for both sides (40 seconds)

Say: "Let's start with the problem, because it affects two groups at once."

Say (pointing at Job seekers): "If you're looking for a job, listings are spread across many different sites. You apply, and then you hear nothing. You have no idea whether anyone even opened your application."

Say (pointing at Recruiters): "If you're a recruiter, it's the opposite problem. Applications arrive by email, get copied into spreadsheets, and there's no single view of which roles are open, who applied, or who's been placed."

Say (pointing at the purple band): "So we asked: what if both sides worked in the same place? That's WorkNest."

Slide 3: Four kinds of user, one platform (25 seconds)

Say: "Our first decision was who we're building for. A **visitor** can browse jobs without signing up. A **candidate** builds a profile, applies and tracks progress. A **recruiter** posts roles and moves applicants through hiring. And an **admin** does all of that, plus managing client companies and candidates. Each person only sees what their role allows."

Slide 4: What each side can do (30 seconds)

Say: "Our approach was to fix each pain point directly. For candidates: one search with filters instead of many sites, a profile you fill in once that pre-fills every application, and a tracker that shows exactly which stage you're at."

Say: "For recruiters: a dashboard instead of spreadsheets, job posts with their own screening questions, and a hiring pipeline where every applicant is scored and moved forward, and the candidate is told automatically."

Slide 5: Browser, API, database (30 seconds)

Say: "Here's how it's built. The part you see is a React website. It talks to our own API, built with Express on Node.js, and the API stores everything in a MongoDB database. The browser never touches the database directly: every request goes through the API, which checks who you are first."

Say (pointing at the bottom row): "We also connect three outside services: Google for sign-in, Brevo for emails, and Cloudinary for storing CVs and logos."

Slide 6: Built with TypeScript end to end (15 seconds)

Say: "We used TypeScript on both the frontend and the backend. Using one language everywhere means the data the server sends always matches what the website expects, and many mistakes are caught before the code even runs."

Slide 7: Security is checked on the server (20 seconds)

Say: "Because we handle people's personal details and CVs, security was part of the approach from day one: passwords are hashed, emails are verified with a one-time code, every login uses a signed token, and the server checks your role on every request."

Hand-over to the demo (10 seconds)

Say: "Enough slides. Let us show you how it actually works, first as a job seeker, then as the recruitment team."

Delivery tips

The introduction sets the mood for the whole talk, so practise it out loud at least three times with a timer.

- **Spend the most time on slide 2.** The problem is what makes the audience care; the tech slides only matter once they do.
- **Pause after "That's WorkNest."** Give the room two seconds before moving on.

- **Point at the slide** as you name each part, so the audience knows where to look.
- **Split the slides if presenting as a team:** one person on slides 1 to 4 (the product), another on 5 to 7 (how it's built), then the demo.
- **Look at the audience, not the screen.** The speaker notes in the deck hold a one-line reminder for each slide.
- **Avoid filler and jargon:** say "the server checks your role", not "we implemented RBAC middleware". Save technical terms for questions.
- **Don't apologise** for anything unfinished. If asked, the roadmap is on slide 9.

Questions you may get

Question	Short answer
Why did you choose this problem?	Both sides of hiring are frustrated: candidates are left in the dark, and recruiters juggle spreadsheets. One platform fixes both.
How is WorkNest different from a normal job board?	A job board stops at the listing. WorkNest also runs the hiring after it: screening questions, scoring, stages and automatic updates to the candidate.
Who would pay for this?	Recruitment agencies and companies hiring regularly; job seekers use it free.
Why build your own API instead of using a ready-made backend?	It let us control security, roles and the hiring rules ourselves, and learn how a real backend works.
Why MongoDB?	Job posts and profiles vary in shape, such as lists of skills and screening answers, which suits documents.
How long did it take, and how did you split the work?	(Fill in with your team's real answer.)
What would you build next?	Server-side search for larger job lists, profile photos, automated tests, and recruiter accounts limited to their own clients.
